

For this week's challenge I decided to work on my programming skills and develop a calculator in JavaScript. I'd consider this project to be way more advanced than the JavaScript project we covered a few weeks ago. I chose to do this project because it would help me to understand the syntax of JavaScript. I'm far more familiar with Python so transitioning to another language for this level of a project was a challenge but it helped me grow at the same time.

What made this project the most difficult was writing the functions to either display inputs from the calculator buttons or having the program properly solve the problem. I did need to watch a lot of YouTube videos to understand key concepts such as **let**, **const** and **querySelector**.

After completing this project I do appreciate the overall outcome, I do plan on utilizing the newfound skills I've gained from this project moving forward in my tech career.
